Engineering of internet things

The idea of project is that when you start a program in the lcd appear a "Enter password". Then you need to enter a password in the keypad and when you entering a password the numbers you entering is showed by this sign '*' in the lcd. When you enter a password and it is correct so the green led is lightning and buzzer make short sound. However , if you enter the wrong password you get "access denied" and the buzzer making longer sound and red led is lightning.

This is the whole project.

Thank you for attention.
